

Preventive Maintenance Schedule

Daily

Run wash and observe all functions including, but not limited to, the following:

- Drive forward, stop, and back up lights function. Signal to processor comes on as soon as vehicle is on the stop pad, and goes off when vehicle is not on the stop pad.
- Check v-rollers for wear and knuckles for tightness.
- Wand and bridge movements should be fluid, not jerky.
- Chemicals and water come out all relevant nozzles, with no gaps in coverage.
- Check wands for excessive kick-out on pressure change.
- Unit measures rear of car and adjusts for small cars.
- Doors function properly.
- All fans on blower moving air (visually check inlets for debris).
- XP winterization system functioning (in season). Check fluid level in tank.
- Count down timer functioning correctly.

Weekly

- Check high pressure pump oil level.
- Check hydraulic pump reservoir oil level at sight gauge (fill with Dexron III ATF).
- Drain excess water from air compressor.
- Check water softeners, reverse osmosis system, carbon filter, and softener salt levels (refer to Manufacturer's instruction for proper settings).
- Clean R/O water stabilizer, if applicable.
- Check drive and idler shaft gears for wear and tightness in rack (bridge and trolley).
- Clean optic lens with soft cloth and glass cleaner.
- Check heat lines in wands for temperature rise (in season).
- Titrate chemicals for concentration.
- Check wand breakaways for wear or stress.
- Check Triple Foam performance.
- If using auto lube, check grease level and look for signs of leaking (faulty hoses or fittings).
- Check both wands for excess play at v-rollers and knuckles.
- If using one point lube system, pump system until you see grease ooze out of a designated fitting. Check for and remove any excess grease on all visible fittings, and look for signs of leaking.

Monthly

- Inspect belts and belt tensioner for wear and tightness. (Always shut off 3-phase power before removing covers.)
- Open IGUS tube covers (at least 4 in line), and inspect hoses and cable. Look for wear, pinching, and crossed hoses in both IGUS tubes.
- Open transition box, bridge box, and trolley box. Check all cables and hose tie-offs to ensure they cannot pull into IGUS tube.
- Check cable connections on all nodes, proximity switches and optic eyes to ensure snugness. If loose, remove, clean or replace as necessary, and lightly coat with dielectric grease before reconnecting.
- Run underbody in remote mode, and inspect nozzles.

Semi-Annually

- Change oil in high pressure pump, unless using a more inclusive schedule. The pump manufacturer recommends changing the oil a minimum of every 500 hours.
- Oil XP winterization pump (3 places).
- Visually inspect all bearings and lube points to ensure good wear characteristics, and that all points are being lubed properly.

Annually

- Change hydraulic oil and filter.
- Grease dryer motors if zerks are available (3 pumps each).

In addition to the above recommendations, you will find detailed maintenance information on various components of your system in the Appendix [Section 10].
